

# Post Acute Covid-19: Recovery Follow-up in Primary Care

1. Post-COVID patient presents to GP with ongoing symptoms  
**Stratification of patients presenting might include:**

- High risk of complications - intensive care unit admissions/ventilated patients
- Medium risk of complications - hospital ward admissions
- Low risk of complications - ED / community patients

2. **GP consultation:** history and examination. Investigations in primary care, as required based on symptoms – Management of post-acute covid-19 in primary care  
<https://dx.doi.org/10.1136/bmj.m3026>  
**Symptom Specific Recommended Management-see below\***

3. **GP supports self-management of common symptoms**  
 Provides the TRFT Health Pathway COVID-19 Patient Information and Rehabilitation Booklet [LINK](#) and direct to the NHSE Post Covid-19 Online Support Tool: <https://www.yourcovidrecovery.nhs.uk/>

4. **Symptoms improve**

5. **Care remains in Primary Care**

6. **Symptoms do not improve 12 weeks post infection - REFER TO VAR (LTC) FOR PRE REFERRAL QUESTIONNAIRE (LINK)**  
 Questionnaire will inform re patients with on going symptoms that have not resolved with self-management, or falls into any of the categories below refer to appropriate service, including those below.

7. **Community Respiratory Team** for post covid assessment if:

- Patient has underlying respiratory condition
- Non-improving or worsening breathlessness
- Patient requires short/long term ambulatory oxygen
- Patient experiencing disproportionate shortness of breath or breathing patterns (often in association with anxiety and in the younger population)

8. **Community-based therapy for:**  
 Holistic Assessment of need, symptoms severely impacting on life or not improving with time and self-management advice including:

- Mobility
- Self-care for daily activities
- Ongoing post viral fatigue
- Swallowing problems
- Voice change
- Weight loss/appetite

9. **Rotherham IAPT Service**  
 If patient experiencing Anxiety, depression, OCD, PTSD

10. **Community Respiratory team** for oxygen desaturation monitoring if:

- Ongoing shortness of breath that is limiting daily activities (that they didn't experience pre COVID-19).
- GP If the patient has progressive, deteriorating breathlessness
- These results, along with Ix results from primary care, are then reviewed with remote input from TRFT Respiratory team/ MDT if needed and advice given on any further investigations required or need to be seen in secondary care
- For further advice contact Community Respiratory Team (Mon-Fri 8.30-16.30) **01709**

Yes

Symptoms improve?

No

11. **Patient discharged** with guidance for on going self management

12. **Referral to Virtual Covid Rehab MDT**  
 If symptoms not improving within community services, the case is complex or there are needs spanning multiple domains, community teams refer to Virtual COVID Rehab MDT for discussion and advice. – THIS IS SOMETHING THAT THE ICS ARE LOOKING AT PROVIDING

**\*Symptom Specific Self Management**

Post Covid Symptom	Considerations specific to COVID-19	Initial investigations to consider as part of clinical assessment	When to deviate from the pathway: <b>Red Flags</b>
<p><b>Fatigue</b></p>	<ul style="list-style-type: none"> <li>• Very common post COVID</li> <li>• Consider impact of fatigue on role – e.g. caregiving, vocation, time off work and phased return.</li> <li>• Self-management advice in the TRFT Health Pathway COVID-19 Patient Information and Rehabilitation booklet <a href="#">LINK</a></li> <li>• Direct patient to NHSE/I <a href="http://www.yourcovidrecovery.nhs.uk">www.yourcovidrecovery.nhs.uk</a></li> <li>• Reassure that with time and self-management fatigue usually improves gradually</li> <li>• If no improvement after 3 months, worsening of symptoms or impacting significantly on life, refer to Community Based Services</li> </ul>	<ul style="list-style-type: none"> <li>• Consider if blood tests are indicated in light of PMHx and clinical assessment.</li> </ul> <p>May include:</p> <ul style="list-style-type: none"> <li>• FBC, Fe, B12 and Folic Acid , renal function, TFTs, vitamin D</li> <li>• O2 sats</li> <li>• Assess and monitor fatigue using the Modified Fatigue Impact Scale <a href="https://www.sralab.org/sites/default/files/2017-06/mfis.pdf">https://www.sralab.org/sites/default/files/2017-06/mfis.pdf</a> (cognitive and physical domains should be scored separately).</li> </ul>	
<p><b>Anxiety, depression and PTSD</b></p>	<ul style="list-style-type: none"> <li>• Common feature post COVID</li> <li>• Consider if fatigue/ pain/ sleep disturbance/ cognition is also contributing or co-occurring.</li> </ul> <p>Online support: <b>Waiting for information from IAPT</b></p> <ul style="list-style-type: none"> <li>• PTSD especially in ITU survivors – ask about intrusive thoughts, flashbacks, nightmares, avoiding reminders of the event/illness. Also excessive/ obsessional cleaning/ checking, fear of going out.</li> <li>• Concerns re PTSD and/ or other mental health issues not improving refer to <b>IAPT</b>. In context of significant fatigue and/ or cognitive issues neuropsychological input will be required.</li> </ul> <p>Other resources: <a href="https://www.bps.org.uk/coronavirus-resources">https://www.bps.org.uk/coronavirus-resources</a></p>	<ul style="list-style-type: none"> <li>• Consider a screening tools PHQ9 for depression or GAD7 for anxiety</li> <li>• Quality of life questionnaire - Work &amp; Social Adjustment Scale (WSAS)</li> <li>• PTSD more likely in context of premorbid trauma</li> <li>• Mood impeding recovery/ causing protracted symptoms where physical examinations are normal.</li> <li>• Complex presentation i.e. contribution of several factors/ lack of progress despite physical recovery/ difficulties completing ADLs or work. <b>Consider referral to IAPT</b></li> <li>• Systemic distress/ carer strain contributing to reactive distress/ relationship breakdown/ loss of support. Refer to Leeds Mental Wellbeing Service</li> </ul>	<ul style="list-style-type: none"> <li>• Suicidal ideation or immediate risk of harm to self or others refer to Mental health crisis team</li> <li>• Neurocognitive problems in the presence of a new or pre-existing neurological diagnosis; refer to Community Neurological Rehab Team</li> </ul>

	<a href="https://www.mind.org.uk/information-support/coronavirus/">https://www.mind.org.uk/information-support/coronavirus/</a>		
<b>Breathlessness</b>	<ul style="list-style-type: none"> <li>• Very common post COVID</li> <li>• Exertional breathlessness often persists for many weeks. Usual pattern is a gradual recovery.</li> <li>• Review at 3 months post Covid if not improving.</li> <li>• Unexplained crackles on auscultation refer for CXR. Depending on the results of this a HRCT scan may also be indicated.</li> <li>• Consider increased risk of VTE / PE post-COVID</li> </ul>	<p><b>CXR.</b> If abnormal, repeat at 6 weeks if symptomatic, or 12 weeks if symptoms have resolved.</p> <ul style="list-style-type: none"> <li>• Bloods: FBC, U&amp;E, LFT, Ca2+, TFT, BNP</li> <li>• Consider sputum sample if productive cough</li> <li>• ECG</li> <li>• O2 sats</li> <li>• Consider referral to Community Respiratory Service for oxygen desaturation monitoring if indicated (as per box 10 above) <b>via ???????</b></li> </ul>	<ul style="list-style-type: none"> <li>• Acute onset (&lt;48 hours) /severe SOB O2&lt;93% (if new for the patient)</li> <li>• Bradycardia &lt;60bpm</li> <li>• Tachycardia &gt;100bpm</li> <li>• RR &gt; 30 breaths/minute Refer PCAL for exclusion of Acute Pathology inc. PE.</li> <li>• Myocardial ischaemia (chest pain)</li> <li>• Syncope/postural dizziness</li> <li>• Heart failure</li> <li>• Shock (hypotension)</li> </ul>
<b>Cough</b>	<ul style="list-style-type: none"> <li>• Cough is a common symptom.</li> <li>• Dry cough likely to be post-viral and self-limiting though can persist for weeks as airways remain hyper-sensitive.</li> </ul>	<ul style="list-style-type: none"> <li>• Consider sputum sample if productive cough</li> <li>• Treat with antibiotics according to current guidelines. If no improvement after 6 weeks request CXR</li> <li>• Follow the <b>Cough Pathway</b>. <b>DO WE WANT TO ADAPT THE LEEDS PATHWAY OR ADOPT THE ROTHERHAM PATHWAY?</b></li> </ul>	<ul style="list-style-type: none"> <li>• Haemoptysis</li> <li>• Unintentional weight loss night sweats</li> <li>• and/or a strong smoking history</li> <li>• urgent 2 week referral is appropriate</li> </ul>
<b>Pleuritic Chest Pain</b>	<ul style="list-style-type: none"> <li>• Flitting chest pains 6-8 weeks post COVID not unusual and do not signify PE in absence of other typical clinical features.</li> </ul> <p>Oxygen saturation normal: PLUS normal chest x-ray:</p> <ul style="list-style-type: none"> <li>• Consider non-respiratory causes (e.g. infection or inflammation elsewhere).</li> </ul> <p>PLUS chest x-ray abnormal/showing</p>	<ul style="list-style-type: none"> <li>• Bloods: FBC, CRP</li> <li>• CXR</li> <li>• O2 sats</li> </ul>	<ul style="list-style-type: none"> <li>• Acute hypoxia, O2&lt;93% (if new for the patient)</li> <li>• Acute severe breathlessness,</li> <li>• Tachycardia &gt;100bpm</li> </ul>

	<p>consolidation:</p> <ul style="list-style-type: none"> <li>• Symptoms may be explained by pneumonia and assess and treat appropriately</li> </ul>		
<b>Palpitations/Tachycardia</b>	<ul style="list-style-type: none"> <li>• Palpitations are common. Up to 30% at 3 months</li> <li>• Tachycardia may be driven by infection</li> <li>• If symptoms persist with no clear cause or if associated with Red Flags, Refer via usual pathways</li> </ul>	<ul style="list-style-type: none"> <li>• Blood tests (including thyroid function)</li> <li>• Erect and supine BP</li> <li>• ECG</li> </ul>	<ul style="list-style-type: none"> <li>• Syncope,</li> <li>• Myocardial ischaemia</li> <li>• Complete heart block</li> </ul>
<b>Anosmia</b>	<ul style="list-style-type: none"> <li>• Very common-up to 50%</li> <li>• 9 out of 10 patients significant improvement within four weeks</li> <li>• Reassurance, Olfactory training and safety advice <a href="https://www.entuk.org/loss-smell-video-interview-professor-claire-hopkins">https://www.entuk.org/loss-smell-video-interview-professor-claire-hopkins</a></li> <li>• Reassess</li> </ul>	<ul style="list-style-type: none"> <li>• Associated nasal symptoms</li> <li>• Neurological symptoms</li> <li>• ENT referral if anosmia &gt;3 months.</li> </ul>	<ul style="list-style-type: none"> <li>• Anosmia&gt;6 weeks with additional neurological symptoms-MRI recommended</li> </ul>
<b>Abnormal Liver Function (mild rise in liver transaminase)</b>	<ul style="list-style-type: none"> <li>• Mild abnormalities in ALT &lt;3xULN will be common post Covid-19.</li> <li>• Approximately 25-30% of tested population in Leeds have abnormal ALT.</li> <li>• Check any past LFTs.</li> <li>• Check alcohol history</li> <li>• Stop any NSAIDS. Do not introduce statins at this stage.</li> <li>• If abnormalities are mild, statins could be continued</li> </ul>	<ul style="list-style-type: none"> <li>• ALT &lt;x3ULN and new: Monitor monthly. It should normalise. Investigate at 3 months if not</li> <li>• ALT &gt;x3ULN and new: Monitor again 2-4 weeks. Investigate at 1 month if not normalised or reducing.</li> <li>• Address any history of excess alcohol, optimise diabetic control, introduce exercise as possible.</li> <li>• Isolated raised bilirubin: Request conjugated/unconjugated bilirubin split.</li> <li>• Isolated raised ALP: Optimise vitamin D levels, Consider Ultrasound scan (to check biliary tract) with Doppler (to check vascular supply); Check BNP as cardiac impairment may give this picture</li> </ul>	<ul style="list-style-type: none"> <li>• Jaundice not attributable to Gilberts syndrome or not in isolation.</li> <li>• Acute liver injury ALT&gt;10xULN</li> <li>• Start investigations immediately and refer for specialist</li> </ul>
<b>Reduction in kidney function following an episode of Acute kidney injury (reduced eGFR)</b>	<ul style="list-style-type: none"> <li>• Observed in small proportion of recovering patients</li> <li>• Assess for improvement or worsening of eGFR over one year</li> </ul>	<ul style="list-style-type: none"> <li>• BP</li> <li>• Dip urine for blood and protein</li> <li>• Urinary Protein/Creatinine ratio</li> <li>• Monitor renal function 2 monthly</li> </ul>	<ul style="list-style-type: none"> <li>• Urinary Protein/Creatinine ratio &gt; 50</li> <li>• Haematuria</li> </ul>

<b>from pre-COVID baseline)</b>	<ul style="list-style-type: none"> <li>Consider referral if progressive fall in eGFR or increasing ACR</li> </ul>	<ul style="list-style-type: none"> <li>Review medication</li> </ul>	<ul style="list-style-type: none"> <li>Sustained fall in eGFR &gt; 5ml/min/month</li> <li>eGFR&lt;30ml/min (new for patient)</li> </ul>
